Static robust optimisation

Adjustable robust optimisation

# Outline of this lecture

Introduction

Static robust optimisation

Adjustable robust optimisation

# What is robust optimisation

An alternative paradigm for taking uncertainty into account:

- ▶ Permeated by the notion of **worst-case**;
- ▶ Control of the degree of **conservatism**;
- ▶ Parallels with **chance constraints** and **risk measures**.

# What is robust optimisation

An alternative paradigm for taking uncertainty into account:

- ▶ Permeated by the notion of **worst-case**;
- ▶ Control of the degree of **conservatism**;
- ▶ Parallels with **chance constraints** and **risk measures**.

Robust optimisation exists in many variants:

- ▶ Static v. adaptable: the presence of **recourse decisions**;
- ▶ Can be extended to **objective function** performance requirements;
- ▶ **Feasibility** is often the key concern in the static case;
- ▶ May or may not be **scenario-based**;
- ▶ Exception: distributionally robust optimisation.

## Robust counterparts

Let us first consider our deterministic (static) model as

$$\begin{aligned} \min_x \quad & c^\top x \\ \text{s.t.:} \quad & A^\top x \leq b \\ & x \in X, \end{aligned}$$

where  $A$  is an  $m \times n$  matrix,  $c$  an  $n$ -vector and  $b$  an  $m$ -vector.

## Robust counterparts

Let us first consider our deterministic (static) model as

$$\begin{aligned} \min_x \quad & c^\top x \\ \text{s.t.:} \quad & A^\top x \leq b \\ & x \in X, \end{aligned}$$

where  $A$  is an  $m \times n$  matrix,  $c$  an  $n$ -vector and  $b$  an  $m$ -vector.

We assume that the  $i$ -th row of  $A$  is **subject to uncertainty**. Thus we define  $X = \{x \in \mathbb{R}^n : A_{i'}^\top x \leq b_{i'} \ \forall i' \in [m] \setminus \{i\}, x \geq 0\}$ , and rewrite it as

$$\begin{aligned} \min_x \quad & c^\top x \\ \text{s.t.:} \quad & A_i^\top x \leq b_i \\ & x \in X. \end{aligned}$$

## Robust counterparts

A **robust counter part** is derived following these steps:

$$\min_x c^\top x$$

$$\text{s.t.: } A_i^\top x \leq b_i$$

$$x \in X$$

$\Downarrow$

$$\min_x c^\top x$$

$$\text{s.t.: } A_i(\eta)^\top x \leq b_i, \forall \eta \in U \subseteq \Xi$$

$$x \in X$$

$\Downarrow$

$$\min_x c^\top x$$

$$\text{s.t.: } \max_{\eta \in U \subseteq \Xi} A_i(\eta)^\top x \leq b_i$$

$$x \in X.$$

# Robust counterparts

A **robust counter part** is derived following these steps:

$$\min_x c^\top x$$

$$\text{s.t.: } A_i^\top x \leq b_i$$

$$x \in X$$

$\Downarrow$

$$\min_x c^\top x$$

$$\text{s.t.: } A_i(\eta)^\top x \leq b_i, \forall \eta \in U \subseteq \Xi$$

$$x \in X$$

$\Downarrow$

$$\min_x c^\top x$$

$$\text{s.t.: } \max_{\eta \in U \subseteq \Xi} A_i(\eta)^\top x \leq b_i$$

$$x \in X.$$

A key concept in robust optimisation is the notion of an **uncertainty set**  $U$ .

- ▶ The set  $U$  within the uncertainty support  $\Xi$  within which **parameter realisations** does not turn the solution infeasible;
- ▶ Tractability is closely tied to the **geometry** of such uncertainty sets;
- ▶ **Remark:** Feasibility is considered **constraint-wise**, i.e., individually for each row  $A_i$  of  $A$  (in the static case).

# Outline of this lecture

Introduction

Static robust optimisation

Adjustable robust optimisation

## Robust counterparts

Let  $\tilde{a}_{ij} \in J_i$  be the **uncertain elements** in the matrix  $A_{m \times n}$

- ▶ Random variables  $\tilde{a}_{ij}$  with “central value”  $a_{ij}$  and “maximum deviation”  $\hat{a}_{ij}$ ;
- ▶ symmetric, bounded support  $\tilde{a}_{ij} \in [a_{ij} - \hat{a}_{ij}, a_{ij} + \hat{a}_{ij}]$ .

---

<sup>1</sup>Assuming, w.l.g.,  $a_{ij} \geq 0, \forall i \in [m], \forall j \in [n]$

## Robust counterparts

Let  $\tilde{a}_{ij} \in J_i$  be the **uncertain elements** in the matrix  $A_{m \times n}$

- ▶ Random variables  $\tilde{a}_{ij}$  with “central value”  $a_{ij}$  and “maximum deviation”  $\hat{a}_{ij}$ ;
- ▶ symmetric, bounded support  $\tilde{a}_{ij} \in [a_{ij} - \hat{a}_{ij}, a_{ij} + \hat{a}_{ij}]$ .

Let  $\eta_{ij} = \frac{(\tilde{a}_{ij} - a_{ij})}{\hat{a}_{ij}}$ . Thus  $\eta_{ij} \in [-1, 1]$  and follows the **same distribution** as  $\tilde{a}_{ij}$ , but centred in zero and scaled.

---

<sup>1</sup>Assuming, w.l.g.,  $a_{ij} \geq 0, \forall i \in [m], \forall j \in [n]$

## Robust counterparts

Let  $\tilde{a}_{ij} \in J_i$  be the **uncertain elements** in the matrix  $A_{m \times n}$

- ▶ Random variables  $\tilde{a}_{ij}$  with “central value”  $a_{ij}$  and “maximum deviation”  $\hat{a}_{ij}$ ;
- ▶ symmetric, bounded support  $\tilde{a}_{ij} \in [a_{ij} - \hat{a}_{ij}, a_{ij} + \hat{a}_{ij}]$ .

Let  $\eta_{ij} = \frac{(\tilde{a}_{ij} - a_{ij})}{\hat{a}_{ij}}$ . Thus  $\eta_{ij} \in [-1, 1]$  and follows the **same distribution** as  $\tilde{a}_{ij}$ , but centred in zero and scaled.

Our **robust counterpart**<sup>1</sup> is the following **bilevel** problem:

$$\begin{aligned} \min_x \quad & c^\top x \\ \text{s.t.} \quad & a_{ij}x_j + \max_{\eta_i \in U_i} \left\{ \sum_{j \in J_i} \eta_{ij} \hat{a}_{ij} x_j \right\} \leq b_i, \forall i \in [m] \\ & x_j \geq 0, \forall j \in [n]. \end{aligned} \tag{RC}$$

---

<sup>1</sup>Assuming, w.l.g.,  $a_{ij} \geq 0, \forall i \in [m], \forall j \in [n]$

# Uncertainty set geometries

Box uncertainty set [Soyster, 1973]

- ▶ **Maximum** protection level;
- ▶ All parameters end taking their worst-possible value;
- ▶ Simple, but highly conservative.

The **uncertainty set** is

$$U_i = \{\eta_i : \|\eta_i\|_1 \leq |J_i|\} \equiv \{\eta_{ij} : |\eta_{ij}| \leq 1, \forall j \in J_i\}$$

# Uncertainty set geometries

Box uncertainty set [Soyster, 1973]

- ▶ **Maximum** protection level;
- ▶ All parameters end taking their worst-possible value;
- ▶ Simple, but highly conservative.

The **uncertainty set** is

$$U_i = \{\eta_i : \|\eta_i\|_1 \leq |J_i|\} \equiv \{\eta_{ij} : |\eta_{ij}| \leq 1, \forall j \in J_i\}$$

The **lower-level problem** becomes

$$\max_{\eta_i \in U_i} \left\{ \sum_{j \in J_i} \eta_{ij} \hat{a}_{ij} x_j : |\eta_{ij}| \leq 1, \forall j \in J_i \right\} = \sum_{j \in J_i} \hat{a}_{ij} x_j.$$

# Uncertainty set geometries

Box uncertainty set [Soyster, 1973]

# Uncertainty set geometries

Box uncertainty set [Soyster, 1973]

# Uncertainty set geometries

Ellipsoidal uncertainty set [Ben-Tal and Nemirovski, 1999]

- ▶ **Softens** extreme-case protection;
- ▶ Parametrically controlled;
- ▶ Leads to smooth sets;
- ▶ (MI)SOCPs which are more computationally demanding.

The **uncertainty set** is

$$U_i = \{\eta_i : \|\eta_i\|_2 \leq \Gamma_i\} \equiv \left\{ \eta_{ij} : \sum_{j \in J_i} \eta_{ij}^2 \leq \Gamma_i^2, \forall j \in J_i \right\}$$

# Uncertainty set geometries

Ellipsoidal uncertainty set [Ben-Tal and Nemirovski, 1999]

- ▶ Softens extreme-case protection;
- ▶ Parametrically controlled;
- ▶ Leads to smooth sets;
- ▶ (MI)SOCPs which are more computationally demanding.

The uncertainty set is

$$U_i = \{\eta_i : \|\eta_i\|_2 \leq \Gamma_i\} \equiv \left\{ \eta_{ij} : \sum_{j \in J_i} \eta_{ij}^2 \leq \Gamma_i^2, \forall j \in J_i \right\}$$

The lower-level problem becomes

$$\max_{\eta_i \in U_i} \left\{ \sum_{j \in J_i} \eta_{ij} \hat{a}_{ij} x_j : \sum_{j \in J_i} \eta_{ij}^2 \leq \Gamma_i^2, \forall j \in J_i \right\}.$$

# Uncertainty set geometries

Ellipsoidal uncertainty set [Ben-Tal and Nemirovski, 1999]

Again, this uncertainty set has a **closed-form** solution. To see that, let us define the vector  $g = (a_{ij}x_j)_{j \in J_i}$ .

Thus we have that

$$\begin{aligned} & \max_{\eta_i \in U_i} \left\{ \sum_{j \in J_i} \eta_{ij} \hat{a}_{ij} x_j : \sum_{j \in J_i} \eta_{ij}^2 \leq \Gamma_i^2, \forall j \in J_i \right\} \\ &= \max_{\eta_i \in U_i} \left\{ g^\top \eta_i : \|\eta_i\|_2 \leq \Gamma_i \right\} \end{aligned}$$

# Uncertainty set geometries

Ellipsoidal uncertainty set [Ben-Tal and Nemirovski, 1999]

Again, this uncertainty set has a **closed-form** solution. To see that, let us define the vector  $g = (a_{ij}x_j)_{j \in J_i}$ .

Thus we have that

$$\begin{aligned} & \max_{\eta_i \in U_i} \left\{ \sum_{j \in J_i} \eta_{ij} \hat{a}_{ij} x_j : \sum_{j \in J_i} \eta_{ij}^2 \leq \Gamma_i^2, \forall j \in J_i \right\} \\ &= \max_{\eta_i \in U_i} \left\{ g^\top \eta_i : \|\eta_i\|_2 \leq \Gamma_i \right\} \\ &= g^\top \left( \Gamma_i \frac{g}{\|g\|_2} \right) = \Gamma_i \frac{\|g\|_2^2}{\|g\|_2} = \Gamma_i \|g\|_2 \end{aligned}$$

# Uncertainty set geometries

Ellipsoidal uncertainty set [Ben-Tal and Nemirovski, 1999]

Again, this uncertainty set has a **closed-form** solution. To see that, let us define the vector  $g = (a_{ij}x_j)_{j \in J_i}$ .

Thus we have that

$$\begin{aligned} & \max_{\eta_i \in U_i} \left\{ \sum_{j \in J_i} \eta_{ij} \hat{a}_{ij} x_j : \sum_{j \in J_i} \eta_{ij}^2 \leq \Gamma_i^2, \forall j \in J_i \right\} \\ &= \max_{\eta_i \in U_i} \left\{ g^\top \eta_i : \|\eta_i\|_2 \leq \Gamma_i \right\} \\ &= g^\top \left( \Gamma_i \frac{g}{\|g\|_2} \right) = \Gamma_i \frac{\|g\|_2^2}{\|g\|_2} = \Gamma_i \|g\|_2 \\ &= \Gamma_i \sqrt{\sum_{j \in J_i} \hat{a}_{ij}^2 x_j^2}. \end{aligned}$$

# Uncertainty set geometries

Ellipsoidal uncertainty set [Ben-Tal and Nemirovski, 1999]

# Uncertainty set geometries

Polyhedral uncertainty set [Bertsimas and Sim, 2004]

- ▶ Allows for controlling conservatism;
- ▶ Retains problem complexity;
- ▶ Budget of uncertainty lacks interpretability.

The budget of uncertainty is

$$U_i = \{\eta_i : \|\eta_i\|_1 \leq \Gamma_i\} \equiv \left\{ \eta_{ij} : \sum_{j \in J_i} \eta_{ij} \leq \Gamma_i, \forall j \in J_i \right\}.$$

# Uncertainty set geometries

Polyhedral uncertainty set [Bertsimas and Sim, 2004]

- ▶ Allows for controlling conservatism;
- ▶ Retains problem complexity;
- ▶ Budget of uncertainty lacks interpretability.

The uncertainty set is

$$U_i = \{\eta_i : \|\eta_i\|_1 \leq \Gamma_i\} \equiv \left\{ \eta_{ij} : \sum_{j \in J_i} \eta_{ij} \leq \Gamma_i, \forall j \in J_i \right\}.$$

The lower-level problem becomes

$$\max_{\eta_i \in U_i} \left\{ \sum_{j \in J_i} \eta_{ij} \hat{a}_{ij} x_j : \sum_{j \in J_i} \eta_{ij} \leq \Gamma_i, 0 \leq \eta_{ij} \leq 1, \forall j \in J_i \right\}.$$

# Uncertainty set geometries

Polyhedral uncertainty set [Bertsimas and Sim, 2004]

In this case, the lower-level problem does not admit a closed form. However, it is a **linear program**.

- ▶ Strong duality (primal-dual equivalence) is available;
- ▶ True for any **convex**<sup>2</sup> lower-level problem.

---

<sup>2</sup>Satisfying some constraint qualification.

# Uncertainty set geometries

# Uncertainty set geometries

Polyhedral uncertainty set [Bertsimas and Sim, 2004]

## Robust counterparts

Let us consider a knapsack problem of the form

$$\begin{aligned} \max. \quad & c^\top x \\ \text{s.t.:} \quad & \sum_{j \in [n]} a_j x_j \leq b \\ & 0 \leq x_j \leq 1, \quad \forall j \in [n]. \end{aligned}$$

## Robust counterparts

Let us consider a knapsack problem of the form

$$\begin{aligned} \max. \quad & c^\top x \\ \text{s.t.:} \quad & \sum_{j \in [n]} a_j x_j \leq b \\ & 0 \leq x_j \leq 1, \quad \forall j \in [n]. \end{aligned}$$

The **robust counterparts** for the previous uncertainty sets are:

### Box

$$\begin{aligned} \max. \quad & c^\top x \\ \text{s.t.:} \quad & \sum_{j \in [n]} (a_j + \hat{a}_j) x_j \leq b \\ & 0 \leq x_j \leq 1, \quad \forall j \in [n]. \end{aligned}$$

### Ellipsoid

$$\begin{aligned} \max. \quad & c^\top x \\ \text{s.t.:} \quad & \sum_{j \in [n]} a_j x_j + \Gamma \sqrt{\sum_{j \in [n]} (\hat{a}_j x_j)^2} \leq b \\ & 0 \leq x_j \leq 1, \quad \forall j \in [n]. \end{aligned}$$

## Robust counterparts

Let us consider a knapsack problem of the form

$$\begin{aligned} \max. \quad & c^\top x \\ \text{s.t.:} \quad & \sum_{j \in [n]} a_j x_j \leq b \\ & 0 \leq x_j \leq 1, \quad \forall j \in [n]. \end{aligned}$$

The **robust counterparts** for the previous uncertainty sets are:

### Polyhedral

$$\begin{aligned} \max. \quad & c^\top x \\ \text{s.t.:} \quad & \sum_{j \in [n]} a_j x_j + \Gamma \pi + \sum_{j \in [n]} p_j \leq b \\ & \pi + p_j \geq \hat{a}_j x_j, \quad \forall j \in [n] \\ & 0 \leq x_j \leq 1, p_j \geq 0, \quad \forall j \in [n] \\ & \pi \geq 0. \end{aligned}$$

# On constraint violation probabilities

Arguably, Bertsimas & Sim (2004) raised attention to robust optimisation with “the price of robustness”.

- ▶ The price refers to the optimality traded off for feasibility guarantees;
- ▶ Quantifying these trade-offs can be done:
  1. Using theoretical bounds;
  2. Via simulating solution performance.
- ▶ In my own experience, theoretical bounds are often loose.

## On constraint violation probabilities

Arguably, Bertsimas & Sim (2004) raised attention to robust optimisation with “the price of robustness”.

- ▶ The price refers to the optimality traded off for feasibility guarantees;
- ▶ Quantifying these trade-offs can be done:
  1. Using theoretical bounds;
  2. Via simulating solution performance.
- ▶ In my own experience, theoretical bounds are often loose.

For example, [Bertsimas and Sim, 2004] show the probability of violation of constraint  $i \in [m]$  to be

$$P^{\text{vio}} = P \left( a_{ij}x_j + \max_{\eta_i \in U_i} \left\{ \sum_{j \in J_i} \eta_{ij} \hat{a}_{ij} x_j \right\} > b_i \right) \leq e^{\frac{-\Gamma^2}{2|J_i|}}.$$

## **Static robust optimisation**

# Outline of this lecture

Introduction

Static robust optimisation

Adjustable robust optimisation

# Multi-stage robust optimisation

We focus on 2-stage adjustable robust optimisation (ARO) problems:

$$\begin{aligned} \min \quad & c^\top x + \max_{\xi \in U \subseteq \Xi} \min_y q(\xi)^\top y(\xi) \\ \text{s.t.} \quad & Ax = b, \quad x \geq 0 \\ & T(\xi)x + Wy(\xi) = h(\xi), \quad \forall \xi \in U \subseteq \Xi \\ & y(\xi) \geq 0, \quad \forall \xi \in \Xi. \end{aligned} \tag{ARO}$$

# Multi-stage robust optimisation

We focus on **2-stage adjustable robust optimisation** (ARO) problems:

$$\begin{aligned} \min \quad & c^\top x + \max_{\xi \in U \subseteq \Xi} \min_y q(\xi)^\top y(\xi) \\ \text{s.t.} \quad & Ax = b, \quad x \geq 0 \\ & T(\xi)x + Wy(\xi) = h(\xi), \quad \forall \xi \in U \subseteq \Xi \\ & y(\xi) \geq 0, \quad \forall \xi \in \Xi. \end{aligned} \tag{ARO}$$

- ▶ Only **RHS** uncertainty:  $T(\xi) = T$ ,  $W(\xi) = W$ , and  $q(\xi) = q$ ,  $\forall \xi \in \Xi$ ;
- ▶ Assumption often necessary to eliminate **quadratic** dependence between  $\xi$  and decision variables;
- ▶ Not necessary if the uncertainty set is **discrete** and **finite** (scenarios)

## A side note: min-max, minimum regret and related

If the uncertainty set is a finite and discrete set of **scenarios**, we have that

$$\begin{aligned} \min_x. \quad & c^\top x + \max_{s \in U} \min_y. \quad q(\xi)_s^\top y_s \\ \text{s.t.:} \quad & Ax = b, \quad x \geq 0 \\ & T_s x + W_s y_s \leq h_s, \quad \forall s \in U. \end{aligned}$$

is a **tractable** ARO [Mulvey et al., 1995].

## A side note: min-max, minimum regret and related

If the uncertainty set is a finite and discrete set of **scenarios**, we have that

$$\begin{aligned} \min_x. \quad & c^\top x + \max_{s \in U} \min_y. \quad q(\xi)_s^\top y_s \\ \text{s.t.:} \quad & Ax = b, \quad x \geq 0 \\ & T_s x + W_s y_s \leq h_s, \quad \forall s \in U. \end{aligned}$$

is a **tractable** ARO [Mulvey et al., 1995]. Variants include:

### Min-max

$$\begin{aligned} \min_{x,y,\theta}. \quad & c^\top x + \theta \\ \text{s.t.:} \quad & \theta \geq q_s^\top y_s, \quad \forall s \in U \\ & Ax = b, \quad x \geq 0 \\ & T_s x + W_s y_s \leq h_s, \quad \forall s \in U. \end{aligned}$$

### Min-regret

$$\begin{aligned} \min_{x,y,\theta}. \quad & c^\top x + \theta \\ \text{s.t.:} \quad & \theta \geq q_s^\top y_s - q_s^\top y_s^*, \quad \forall s \in U \\ & Ax = b, \quad x \geq 0 \\ & T_s x + W_s y_s \leq h_s, \quad \forall s \in U. \end{aligned}$$

where  $y_s^*$  is optimal for  $s \in U$ .

## Affinely adjustable robust optimisation [Ben-Tal et al., 2004]

One approach for modelling adjustability is using **affine policies**:

- ▶ Replace  $y(\xi)$  with  $\alpha + \beta\xi$ ;
- ▶  $h(\xi)$  is assumed **affinely dependent** on  $\xi$ , e.g.:  $h(\xi) = h - \hat{h}\xi$ .

## Affinely adjustable robust optimisation [Ben-Tal et al., 2004]

One approach for modelling adjustability is using **affine policies**:

- ▶ Replace  $y(\xi)$  with  $\alpha + \beta\xi$ ;
- ▶  $h(\xi)$  is assumed **affinely dependent** on  $\xi$ , e.g.:  $h(\xi) = h - \hat{h}\xi$ .

Then ARO becomes:

$$\begin{aligned} \min_{x, \alpha, \beta} \quad & c^\top x + \theta \\ \text{s.t.:} \quad & \theta \geq q^\top (\alpha + \beta\xi), \quad \forall \xi \in U \\ & Ax = b, \quad x \geq 0 \\ & Tx + W(\alpha + \beta\xi) \leq h(\xi), \quad \forall \xi \in U \\ & y(\xi) \geq 0, \quad \forall \xi \in U. \end{aligned}$$

## Affinely adjustable robust optimisation [Ben-Tal et al., 2004]

One approach for modelling adjustability is using **affine policies**:

- ▶ Replace  $y(\xi)$  with  $\alpha + \beta\xi$ ;
- ▶  $h(\xi)$  is assumed **affinely dependent** on  $\xi$ , e.g.:  $h(\xi) = h - \hat{h}\xi$ .

Then ARO becomes:

$$\begin{aligned} \min_{x, \alpha, \beta} \quad & c^\top x + \theta \\ \text{s.t.:} \quad & \theta \geq q^\top (\alpha + \beta\xi), \quad \forall \xi \in U \\ & Ax = b, \quad x \geq 0 \\ & Tx + W(\alpha + \beta\xi) \leq h(\xi), \quad \forall \xi \in U \\ & y(\xi) \geq 0, \quad \forall \xi \in U. \end{aligned}$$

Similar to the static case, computational **tractability** can be achieved:

- ▶ Requires that  $U$  is a box or ellipsoidal set;
- ▶ For a practical example, see [Ben-Tal et al., 2005]

## Adjustable robust optimisation

An **alternative** approach: looking closer at the inner problem as a **bilevel** optimisation problem.

Let us restate our ARO in a simplified notation. For that, let

- ▶  $X = \{x \in \mathbb{R}^{n_1} : Ax = b, x \geq 0\};$
- ▶  $Y = \{y \in \mathbb{R}^{n_2} : y \geq 0\};$
- ▶ Uncertainty in **RHS only**, with  $h(\xi) = h - \hat{h}\xi$ , and  $\xi \in [\underline{\xi}, \bar{\xi}]$

## Adjustable robust optimisation

An **alternative** approach: looking closer at the inner problem as a **bilevel** optimisation problem.

Let us restate our ARO in a simplified notation. For that, let

- ▶  $X = \{x \in \mathbb{R}^{n_1} : Ax = b, x \geq 0\};$
- ▶  $Y = \{y \in \mathbb{R}^{n_2} : y \geq 0\};$
- ▶ Uncertainty in **RHS only**, with  $h(\xi) = h - \hat{h}\xi$ , and  $\xi \in [\underline{\xi}, \bar{\xi}]$

Then we have that ARO is equivalent to

$$\min_{x \in X} c^\top x + \mathcal{Q}(x), \quad (\text{ARO})$$

where

$$\mathcal{Q}(x) = \left\{ \max_{\xi \in U} \min_{y \in Y} q^\top y : Tx = (h - \hat{h}\xi) - Wy \right\}.$$

## Adjustable robust optimisation & CCG

Let us assume that an **oracle** is available such that, for a given  $\bar{x} \in X$  it evaluates  $Q(x)$  and returns associated  $(\bar{\xi}, \bar{y})$ , if they exist.

## Adjustable robust optimisation & CCG

Let us assume that an **oracle** is available such that, for a given  $\bar{x} \in X$  it evaluates  $\mathcal{Q}(x)$  and returns associated  $(\bar{\xi}, \bar{y})$ , if they exist.

In addition, let us assume that the uncertainty set is **finitely** representable:

- ▶ Scenarios, but an **intractable amount** of them (e.g., samples, or data)
- ▶ **Polyhedral** set (finite extreme points and rays)

## Adjustable robust optimisation & CCG

Let us assume that an **oracle** is available such that, for a given  $\bar{x} \in X$  it evaluates  $\mathcal{Q}(x)$  and returns associated  $(\bar{\xi}, \bar{y})$ , if they exist.

In addition, let us assume that the uncertainty set is **finitely** representable:

- ▶ Scenarios, but an **intractable amount** of them (e.g., samples, or data)
- ▶ **Polyhedral** set (finite extreme points and rays)

In that case, we can employ **column-and-constraint generation** (CCG)

[Zeng and Zhao, 2013] to solve ARO:

Main problem  $M^k$ :  $\bar{x}^{k+1}$

$$\min_{x, y, \theta} c^\top x + \theta$$

$$\theta \geq q^\top y_l, \quad l \in [k]$$

$$x \in X$$

$$Tx = h - \hat{h}\bar{\xi}_l - Wy_l, \quad l \in [k]$$

$$y_l \in Y, \quad l \in [k].$$

Oracle  $\mathcal{Q}(\bar{x}^{k+1})$ :  $\bar{\xi}^{k+1}$

$$\max_{\xi \in U} \min_{y \in Y} q^\top y$$

$$\text{s.t.: } T\bar{x}^{k+1} = (h - \hat{h}\xi) - Wy.$$

# Adjustable robust optimisation & CCG

In summary, the CCG method can be stated as

1. **Initialisation.**  $LB = -\infty$ ,  $UB = \infty$ ,  $k = 0$ .

# Adjustable robust optimisation & CCG

In summary, the CCG method can be stated as

1. **Initialisation.**  $LB = -\infty$ ,  $UB = \infty$ ,  $k = 0$ .
2. **Solve the main problem  $M^k$ .** Let  $\underline{z}^k = c^\top x^k + \theta^k$ , where  $\operatorname{argmin} M^k = (x^k, \theta^k, \{y_l^k\}_{l=1}^k)$ . Make  $LB = \underline{z}^k$ .

In summary, the CCG method can be stated as

1. **Initialisation.**  $LB = -\infty$ ,  $UB = \infty$ ,  $k = 0$ .
2. **Solve the main problem  $M^k$ .** Let  $\underline{z}^k = c^\top x^k + \theta^k$ , where  $\operatorname{argmin} M^k = (x^k, \theta^k, \{y_l^k\}_{l=1}^k)$ . Make  $LB = \underline{z}^k$ .
3. **Solve  $Q(x^k)$ .** Let  $\operatorname{argmax} Q(x^k) = (\bar{\xi}^{k+1}, \bar{y}^{k+1})$ , if it exists. Let  $\bar{z}^k = c^\top x^k + Q(x^k)$ . Make  $UB = \min \{UB, \bar{z}^k\}$ . **If  $UB = LB < \epsilon$ , return  $x^k$ .**
4. **Add column and constraints to  $M^k$ .** If  $Q(x^k)$  is feasible, create columns  $y_{k+1}$  and, together with the constraints

$$\theta \geq q^\top y_{k+1} \tag{1}$$

$$Tx = h - \hat{h}\bar{\xi}_{k+1} - Wy_{k+1}, \quad y_{k+1} \in Y, \tag{2}$$

add them to  $M^k$ , forming  $M^{k+1}$ . Make  $k = k + 1$  and return to [Step 2](#). If  $Q(x^k)$  is not feasible, then only (2) is created.

# Adjustable robust optimisation & CCG

## Practical remarks

Essentially, CCG for ARO is a **delayed-generation** approach of the min-max formulation

- ▶ Can thus be useful when **too many scenarios** are available;
- ▶ Convergence relies on a **finiteness argument** on the uncertainty set.

## Practical remarks

Essentially, CCG for ARO is a **delayed-generation** approach of the min-max formulation

- ▶ Can thus be useful when **too many scenarios** are available;
- ▶ Convergence relies on a **finiteness argument** on the uncertainty set.

CCG can be seen as a **primal equivalent** to Benders decomposition

- ▶ One can use the same column generation approach in the context of the L-shaped method [Van Slyke and Wets, 1969];
- ▶ This can help as a way to **transmit** “recourse information” to the main problem.

# Adjustable robust optimisation & CCG

On solving  $\mathcal{Q}(x)$

Recall that  $\mathcal{Q}(x)$  is of the form

$$\mathcal{Q}(x) = \max_u q^\top y$$

$$\text{s.t.: } \xi \in U$$

$$y \in \operatorname{argmin}_y q^\top y$$

$$\text{s.t.: } Tx = h - \hat{h}\xi - Wy$$

$$y \in Y.$$

# Adjustable robust optimisation & CCG

On solving  $\mathcal{Q}(x)$

Recall that  $\mathcal{Q}(x)$  is of the form

$$\begin{aligned}\mathcal{Q}(x) = & \max_u q^\top y \\ \text{s.t.: } & \xi \in U \\ & y \in \operatorname{argmin}_y q^\top y \\ & \text{s.t.: } Tx = h - \hat{h}\xi - Wy \\ & y \in Y.\end{aligned}$$

This is a **bilevel model** and can be solved using dedicated methods.

- ▶ Most techniques rely on **posing optimality conditions** of the lower-level problem to yield an **equivalent single-level** (tractable) problem;
- ▶ Thus, **lower-level convexity** (plus constraint qualification) is often a requirement.

# Adjustable robust optimisation & CCG

On solving  $\mathcal{Q}(x)$

Example: assume that  $Y = \mathbb{R}_+^{n_2}$ . We can use strong duality to reformulate the lower-level problem, obtaining

$$\begin{aligned}\mathcal{Q}(x) = & \max_{\xi, \pi} (h - \hat{h}\xi - Tx)^\top \pi \\ \text{s.t.}: & \pi^\top W \leq q^\top \\ & \xi \in U.\end{aligned}$$

# Adjustable robust optimisation & CCG

On solving  $\mathcal{Q}(x)$

Example: assume that  $Y = \mathbb{R}_+^{n_2}$ . We can use strong duality to reformulate the lower-level problem, obtaining

$$\begin{aligned}\mathcal{Q}(x) = & \max_{\xi, \pi} (h - \hat{h}\xi - Tx)^\top \pi \\ \text{s.t.: } & \pi^\top W \leq q^\top \\ & \xi \in U.\end{aligned}$$

$\mathcal{Q}(x)$  is solvable, if:

1.  $\xi$  is integer or has a discrete domain, since  $\xi^\top \pi$  can be reformulated exactly (e.g., [Rintamäki et al., 2023]);
2. if  $-(\hat{h}\xi)^\top \pi + (h - Tx)^\top \pi$  is a **concave bilinear** function in  $\pi$  and  $\xi$ ;
3. if applying a **global solver** (e.g., Gurobi's spatial branch-and-bound method) is feasible from a computational standpoint.
